# 2. Terms and Definitions

Term	Explanation and Definition
Node	Controllers and devices are connected to the EtherNet/IP network via
	the EtherNet/IP ports. EtherNet/IP recognizes each EtherNet/IP port
	connected to the network as one node.
	When a device with two EtherNet/IP ports is connected to the
	EtherNet/IP network, EtherNet/IP recognizes this device as two nodes.
	EtherNet/IP achieves the communications between controllers or the
	communications between controllers and devices by exchanging data
	between these nodes connected to the network.
Tag	A minimum unit of the data that is exchanged on the EtherNet/IP network
	is called a tag. The tag is defined as a network variable or as a physical
	address, and it is allocated to the memory area of each device.
Tag set	In the EtherNet/IP network, a data unit that consists of two or more tags
	can be exchanged. The data unit consisting of two or more tags for the
	data exchange is called a tag set. Up to eight tags can be configured per
	tag set for OMRON controllers.
Tag data link	In EtherNet/IP, the tag and tag set can be exchanged cyclically between
	nodes without using the user program. This standard feature on
	EtherNet/IP is called a tag data link.
Connection	A connection is used to exchange data as a unit within which data
	concurrency is maintained. The connection consists of tags or tag sets.
	Creating the concurrent tag data link between the specified nodes is
	called a "connection establishment". When the connection is
	established, the tags or tag sets that configure the connection are
	exchanged between the specified nodes concurrently.
	Specifying the tag set name (tag name) and specifying the instance
	number of Assembly Object are given as methods to specify the
	connection. In Sysmac Studio, the connection is set by specifying the
	instance number.
Connection type	There are two kinds of connection types for the tag data link connection,
	one is a multi-cast connection and the other is a unicast (point-to-point)
	connection. The multi-cast connection sends an output tag set in one
	packet to multiple nodes. The unicast connection separately sends one
	output tag set to each node. Therefore, multi-cast connections can
	decrease the communications load if one output tag set is sent to
	multiple nodes.

# 2. Terms and Definitions

Term	Explanation and Definition
Originator and	To perform tag data links, one node requests the opening of a
Target	communications line called a "connection".
	The node that requests to open the connection is called an "originator",
	and the node that receives the request is called a "target".
	Each data for communications is called an "originator variable" and a
	"target variable".
	In Sysmac Studio, the instance number is specified in the target variable.
Tag data link	The tag data link parameter is the setting data to perform the tag data
parameter	link. It includes the data to set tags, tag sets, and connections.
RPI	An abbreviation for Requested Packet Interval.
	RPI indicates the data I/O refresh cycle that is set for each connection
	between the originator and the target.

# 3. Precautions

- (1) Understand the specifications of devices which are used in the system. Allow some margin for ratings and performance. Provide safety measures, such as installing safety circuit in order to ensure safety and minimize risks of abnormal occurrence.
- (2) To ensure system safety, make sure to always read and heed the information provided in all Safety Precautions and Precautions for Safe Use of manuals for each device which is used in the system.
- (3) The user is encouraged to confirm the standards and regulations that the system must conform to.
- (4) It is prohibited to copy, to reproduce, and to distribute a part or the whole of this document without the permission of OMRON Corporation.
- (5) The information contained in this document is current as of April 2015. It is subject to change without notice for improvement.

The following notation is used in this document.

Indicates a potentially hazardous situation which, if not avoided, will result in minor or moderate injury, or may result in serious injury or death. Additionally there may be significant property damage.

Indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury or property damage.

#### **Precautions for Correct Use**

Precautions on what to do and what not to do to ensure proper operation and performance.

# **Additional Information**

Additional information to read as required.

This information is provided to increase understanding or make operation easier.

#### **Symbol**

The filled circle symbol indicates operations that you must do. The specific operation is shown in the circle and explained in text. This example shows a general precaution for something that must do.

# 4. Overview

This document describes the procedure for connecting Vision System (FH series) of OMRON to NJ-series Machine Automation Controller (hereinafter referred to as Controller) via EtherNet/IP and provides the procedure for checking their connection.

Hereinafter, the device connected via EtherNet/IP in Vision System is referred to as "FH Sensor Controller".

Refer to Section 6. EtherNet/IP Settings and Section 7. EtherNet/IP Connection Procedure to understand the setting method and key points to perform the tag data links for EtherNet/IP.

## **Additional Information**

Settings which are described in 7.3. Setting up Controller are set in advance into the Sysmac Studio compact project file (hereinafter referred to as project file). Refer to Section 9. Appendix Procedure Using the Project File for usage method of the project file. Obtain the latest project file from OMRON.

Name	File name	Version
Sysmac Studio compact project file (Extension: csm2)	OMRON_FH_EIP_EV200.csm2	Ver.2.00

# 5. Applicable Devices and Device Configuration

# 5.1. Applicable Devices

The applicable devices are as follows:

Manufacturer	Name	Model
OMRON	NJ-series CPU Unit	NJ501-[][][][] NJ301-[][][][]
OMRON	FH Sensor Controller	FH-1050/3050 FH-1050/3050-[]0
OMRON	12 Megapixel High-Speed Camera 4 Megapixel High-Speed Camera 2 Megapixel High-Speed Camera 0.3 Megapixel High-Speed Camera	FH-SC12/SM12 FH-SC04/SM04 FH-SC02/SM02 FH-SC/SM
	5 Megapixel Digital Camera 2 Megapixel Digital Camera 0.3 Megapixel Digital Camera 0.3 Megapixel High-Speed Camera 0.3 Megapixel Small Digital Camera 0.3 Megapixel Small Digital Pen-Shaped Camera Intelligent Compact Camera	FZ-SC5M2/S5M2 FZ-SC2M/S2M FZ-SC/S FZ-SHC/SH FZ-SFC/SF FZ-SPC/SP FZ-SQ010F/SQ050F FZ-SQ100F/SQ100N

## **Precautions for Correct Use**

As applicable devices above, the devices with the models and versions listed in *5.2. Device Configuration* are actually used in this document to describe the procedure for connecting devices and checking the connection.

You cannot use devices with versions lower than the versions listed in *5.2.* To use the above devices with models not listed in *5.2.* or versions higher than those listed in *5.2.*, check the differences in the specifications by referring to the manuals before operating the devices.

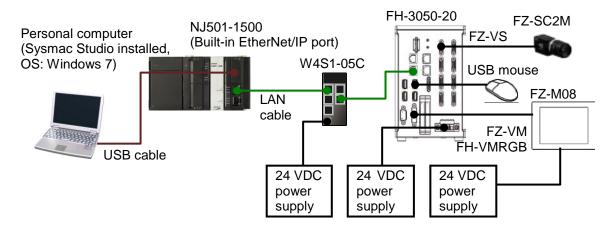

#### **Additional Information**

This document describes the procedure to establish the network connection. It does not provide information on operation, installation or wiring method which is not related to the connection procedure. It also does not describe the functionality or operation of the devices. Refer to the manuals or contact the device manufacturer.

# 5.2. Device Configuration

The hardware components to reproduce the connection procedure of this document are as follows:

Manufacturer	Name	expression	Version
OMRON	NJ-series CPU Unit	NJ501-1500	Ver.1.09
	(Built-in EtherNet/IP port)		
OMRON	Power Supply Unit	NJ-PA3001	
OMRON	Switching hub	W4S1-05C	Ver.1.00
-	24 VDC power supply	-	
	(For Switching hub)		
OMRON	Sysmac Studio	SYSMAC-SE2[][][]	Ver.1.10
-	Personal computer	-	
	(OS: Windows 7)		
-	USB cable	-	
	(USB 2.0 type B connector)		
-	LAN cable (STP (shielded,	-	
	twisted-pair) cable of Ethernet		
	category 5 or higher)		
OMRON	FH Sensor Controller	FH-3050-20	Ver.5.32
OMRON	Camera	FZ-SC2M	
OMRON	Camera cable	FZ-VS[]	
OMRON	Monitor (analog RGB monitor)	FZ-M08	
OMRON	Monitor cable	FZ-VM	
OMRON	Monitor conversion connector	FH-VMRGB	
-	USB mouse	-	
-	24 VDC power supply	-	
	(For FH Sensor Controller)		
-	24 VDC power supply	-	
	(For Monitor)		

#### **Precautions for Correct Use**

Update Sysmac Studio to the version specified in this clause or higher version. If you use a version lower than the one specified in this clause, procedures described in Section 7. and subsequent sections may not be applicable. In that case, use the equivalent procedures described in this document by referring to the *Sysmac Studio Version 1 Operation Manual* (Cat. No. W504).

#### **Additional Information**

For specifications of 24 VDC power supply available for Switching hub, refer to the *Switching Hub W4S1-series Users Manual* (Cat. No. 0969584-7).

#### **Additional Information**

For specifications of 24 VDC power supply available for FH Sensor Controller, refer to the *Image Processing System INSTRUCTION SHEET* (Cat. No. 2285550-0).

## **Additional Information**

For specifications of 24 VDC power supply available for Monitor, refer to the *LCD monitor INSTRUCTION SHEET* (Cat. No. 1636843-6).

#### **Additional Information**

The system configuration in this document uses USB for the connection to Controller. For information on how to install a USB driver, refer to *A-1 Driver Installation for Direct USB Cable Connection* of the *Sysmac Studio Version 1 Operation Manual* (Cat. No. W504).

# 6. EtherNet/IP Settings

This section describes the specifications of parameters, global variables, tag sets, and a tag data link table that are all defined in this document.

Hereinafter, FH Sensor Controller is referred to as "Destination Device" in some descriptions.

#### 6.1. Parameters

This clause describes the parameters that are set in this document.

#### 6.1.1. EtherNet/IP Communications Settings

The parameters required for connecting Controller and Destination Device via EtherNet/IP are given below.

Item	Controller	FH Sensor Controller
IP address	192.168.250.1	192.168.250.2
Subnet mask	255.255.255.0	255.255.255.0

# 6.1.2. Setting up FH Sensor Controller

The parameters for FH Sensor Controller are given below.

Item	Set value
Fieldbus	EtherNet/IP
Output control	Handshaking (Default)
Timeout [s]	10.0 (Default)

#### **Precautions for Correct Use**

In order to prevent a phenomenon that a change in the status of each signal cannot be detected by the target device, it is recommended that you set the Output control setting for FH Sensor Controller to Handshaking.

When the Output control of FH Sensor Controller is set to None, the originator device may not correctly detect a change in the status of a signal from FH Sensor Controller if RPI is longer than the output time (ON/OFF) on FH Sensor Controller.

For details, refer to EtherNet/IP Communications Cycle (RPI) in Data Exchange with EtherNet/IP in Communicating with EtherNet/IP in Section 2. Methods for Connecting and Communicating with External Devices of the Vision Sensor FH/FZ5 Series Vision System User's Manual for Communications Settings (Cat. No. Z342).

# 6.2. Data Types for Tag Data Links

The following data types are used for the data in the tag data links of Destination Device.

■ Definition of the data type to access the signals (Unions)

This data type is used to access the control signals and status signals.

Data type na	ame Data type
U_EIPFlag	UNION
F	BOOL[32]
W	DWORD

■ Definition of the data type to access the command area (Structures)

This data type is used to access the command area.

Data type name		Data type	Destination Device data
	S_EIPOutput	STRUCT	-
	ControlFlag	U_EIPFlag	Control signal (32 bits)
	CommandCode	DWORD	Command code (CMD-CODE)
	CommandParam1	DINT	Command parameter
	CommandParam2	DINT	Command parameter (CMD-PARAM)
	CommandParam3	DINT	(CIVID-PARAIVI)

■ Definition of the data type to access the response/output areas (Structures)

This data type is used to access the response/output areas.

	Data type name	Data type	Destination Device data
S_EIPInput		STRUCT	-
	StatusFlag	U_EIPFlag	Control output (32 bits)
	CommandCodeEcho	DWORD	Command code (CMD-CODE)
	ResponseCode	DWORD	Response code (RES-CODE)
	ResponseData	DINT	Response data (RES-DATA)
	OutputData	DINT[8]	Output data 0 to 7 (DATA 0 to 7)

#### **Additional Information**

For details on structures and unions, refer to Accessing Communications Areas Using Variables with NJ-series Controllers in Communicating with EtherNet/IP in Section 2.

Methods for Connecting and Communicating with External Devices of the Vision Sensor FH/FZ5 Series Vision System User's Manual for Communications Settings (Cat. No. Z342).

# 6.3. Global Variables

The Controller treats the data in tag data links as global variables. The settings of the global variables are the following.

Name	Data tuna	Network	Destination Device	Data size
	Data type	publish	allocation	(byte)
EIPOutput	S_EIPOutput	Output	Command code	20
EIPInput	S_EIPInput	Input	Response code	48

## **■**EIPOutput Configuration

Destination Device data	Variable name	Data type	
		U_EIPFlag	
Control signal (32 bits)	EIPOutput.ControlFlag.F <sup>*1</sup>	BOOL[32]	
	EIPOutput.ControlFlag.W	DWORD	
Command code (CMD-CODE)	EIPOutput.CommandCode	DWORD	
Command parameter	EIPOutput.CommandParam1	DINT	
Command parameter (CMD-PARAM)	EIPOutput.CommandParam2	DINT	
(CIVID-PARAIVI)	EIPOutput.CommandParam3	DINT	

## \*1: Details on allocation of control signal

Allocation of EIPOutput.ControlFlag.F variable

7 1110	040.	. 0	• • •	P 41.0	0111101	ug	. τα	40.0							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ERCLR							XEXE							STEP	EXE
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
															DSA

EXE: Command Execution Bit: Turns ON to execute a command.

STEP: Measure Bit: Turns ON to execute a measurement.

XEXE: Flow Command Request Bit: Turns ON to request execution of a command during execution of fieldbus flow control.

ERCLR: Error Clear Bit: Turns ON to clear the ERR signal.

DSA: Data Output Request Bit: Turns ON to request the next data output.

#### ■EIPInput Configuration

Destination Device data	Variable name	Data type		
		U_EIPFlag		
Control output (32 bits)	EIPInput.StatusFlag.F <sup>*1</sup>	BOOL[32]		
	EIPInput.StatusFlag.W	DWORD		
Command code	EIPInput.CommandCodeEcho	DWORD		
(CMD-CODE)	El input.CommandCodeEcho	DWORD		
Response code	EIPInput.ResponseCode	DWORD		
(RES-CODE)	Lir input. Nesponsecode			
Response data	EIPInput.ResponseData	DINT		
(RES-DATA)	Lir iliput. Nespolisebata			
Output data 0 (DATA0)				
Output data 1 (DATA1)				
Output data 2 (DATA2)				
Output data 3 (DATA3)	EIPInput.OutputData	DINT[8]		
Output data 4 (DATA4)		DINT[0]		
Output data 5 (DATA5)				
Output data 6 (DATA6)				
Output data 7 (DATA7)				

#### \*1: Details on allocation of control signal

Allocation of EIPInput.StatusFlag.F variable

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ERR					TIAWX	XBUSY	XFLG				RUN	OR		BUSY	FLG
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
															GATE

FLG: Command Completion Bit: Turns ON when command execution is completed.

BUSY: Command Busy Bit: Turns ON when command execution is in progress.

OR: Overall Judgement: Turns ON when the overall judgement is NG.

RUN: Run Mode: Turns ON while FH Sensor Controller is in Run Mode.

XFLG: Flow Command Completion Bit: Turns ON when execution of a command that was input during the execution of fieldbus flow control has been completed. (i.e., when XBUSY turns OFF)

XBUSY: Flow Command Busy Bit: Turns ON when execution of a command that was input during execution of fieldbus flow control is in progress.

XWAIT: Flow Command Wait Bit: Turns ON when a command can be input during the execution of fieldbus flow control.

ERR: Error signal: Turns ON when FH Sensor Controller detects an error signal.

GATE: Data Output Completion Bit: Turns ON when data output is completed.

## **Precautions for Correct Use**

If the data size of tag data links for Destination Device is an odd-numbered byte, use BYTE type to define, do not use BOOL type.

## **Additional Information**

For details on command codes and response codes, refer to Command Details for PLC Link, EtherNet/IP, and EtherCAT in Command Control in Section 3. Appendices of the Vision Sensor FH/FZ5 Series Vision System User's Manual for Communications Settings (Cat.No. Z342).

#### **Additional Information**

With Sysmac Studio, two methods can be used to specify an array for a data type. After specifying, (1) is converted to (2) and the data type is always displayed as (2). (1)BOOL[16] / (2)ARRAY[0..15] OF BOOL

In this document, the data type is simplified by displaying BOOL[16].

(The example above means a BOOL data type with sixteen array elements.)

# 6.4. Tag Sets

This clause provides the detailed settings of the tag sets to execute the processing for the tag data links. Data in the tag sets are allocated in the following OUT No. and IN No.

#### ■ Output area (from Controller to FH Sensor Controller)

	Origina	Data size (byte)	
Е	IP002_OUT	20	
	OUT No.	Global variable name (tag name)	Data size (byte)
	1	EIPOutput	20

#### ■Input area (from FH Sensor Controller to Controller)

	Origina	Data size (byte)	
Е	IP002_IN	48	
	IN No.	Global variable name (tag name)	Data size (byte)
	1	EIPInput	48

# 6.5. Tag Data Link Table

This clause describes the detailed settings of the tag data link table (connection settings). On FH Sensor Controller, set the connection type to **Point to Point** for both input and output. Set the timeout value so that it is longer than FH Sensor Controller's measurement processing time.

When the measurement interval is short, the measurement processing load is high, or command processing for operations such as scene group changing is time-consuming, FH Sensor Controller prioritizes measurement and control processing over communication processing. As a result, communication between an external device and FH Sensor Controller may be temporarily interrupted, and a communication error may occur. In this case, set the communication error timeout time longer than FH Sensor Controller's processing time. The values in a red frame are taken from the values in EDS file of Destination Device.

Connection Name	Connection I/O Type	RPI (ms)	Timeout Value
default_001	Consume Data From/Produce Data To	50.0	RPI x 4

Connection I/O Type	Input/ Output	Target Variable (Set value of Destination Device: instance number)	Size (byte)	Originator Variable (tag set name)	Size (byte)	Connection Type
Consume Data	Input	101	48	EIP002_IN	48	Point to Point connection
From/Produ ce Data To	Output	100	20	EIP002_OUT	20	Point to Point connection

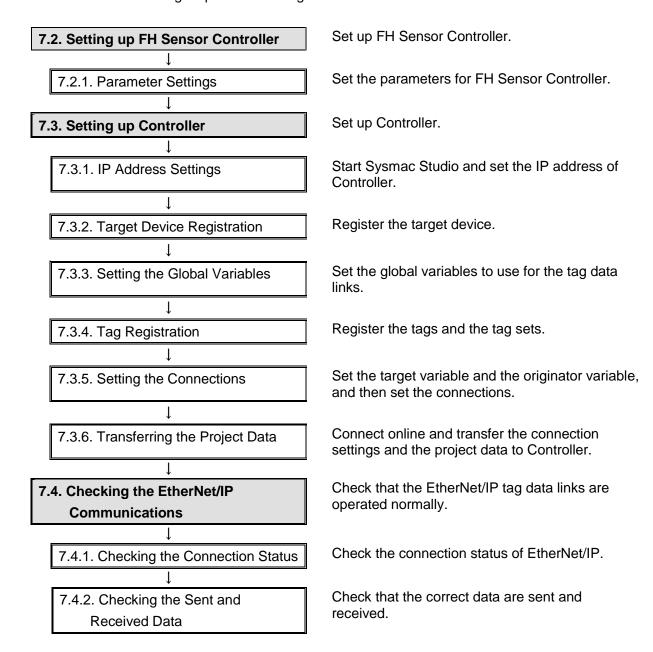

# 7. EtherNet/IP Connection Procedure

This section describes the procedure for connecting FH Sensor Controller and Controller on the EtherNet/IP network.

This document explains the procedures for setting up Controller and FH Sensor Controller based on the factory default setting. For the initialization, refer to Section 8. Initialization Method.

# 7.1. Work Flow

Take the following steps to set the tag data link for EtherNet/IP.

# 7.2. Setting up FH Sensor Controller

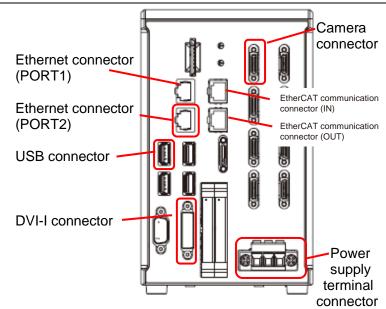

Set up FH Sensor Controller.

# 7.2.1. Parameter Settings

Set the parameters for FH Sensor Controller.

1 Check the positions of the connectors on FH Sensor Controller by referring to the right figure.

\*In the Ethernet connectors, only PORT2 (lower port) can be used for EtherNet/IP communications. PORT1 (upper port) and the EtherCAT communication connector cannot be used for EtherNet/IP.

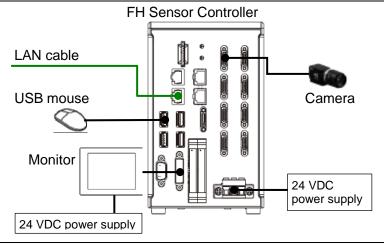

As shown in 5.2. Device
Configuration, connect Camera,
Monitor, USB mouse, and 24
VDC power supply (For FH
Sensor Controller) to FH Sensor
Controller.

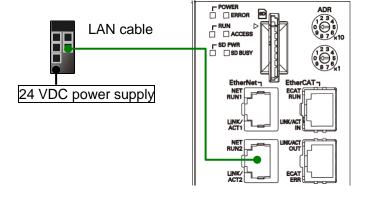

Connect LAN cable to PORT2 (lower port) of Ethernet connector.

Connect 24 VDC power supply (For Monitor) to Monitor.

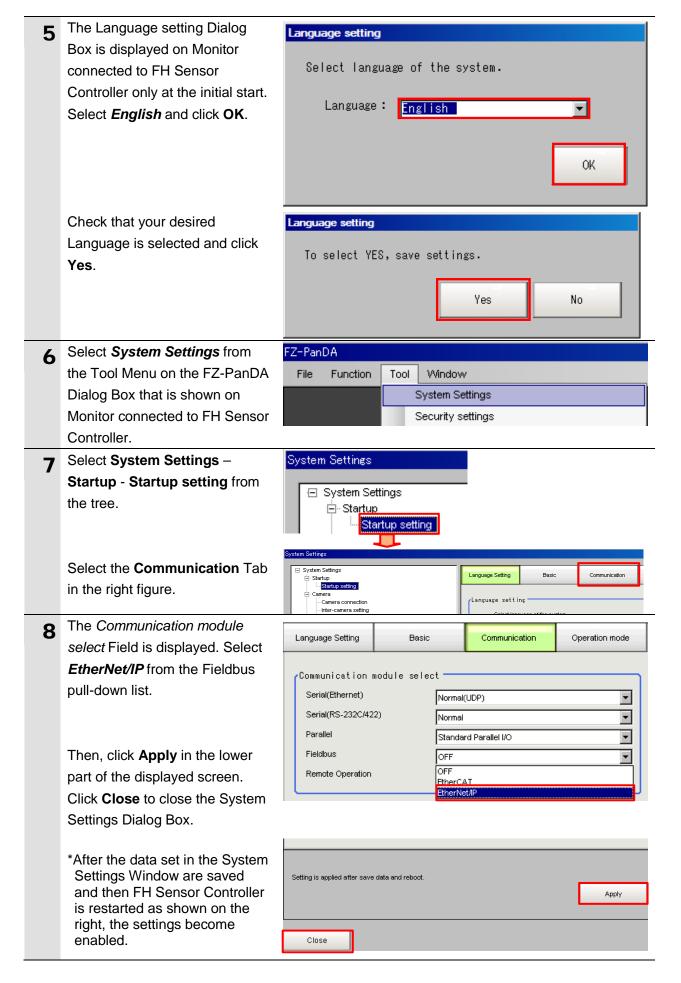

3 Connect FH Sensor Controller to Switching hub with LAN cable.

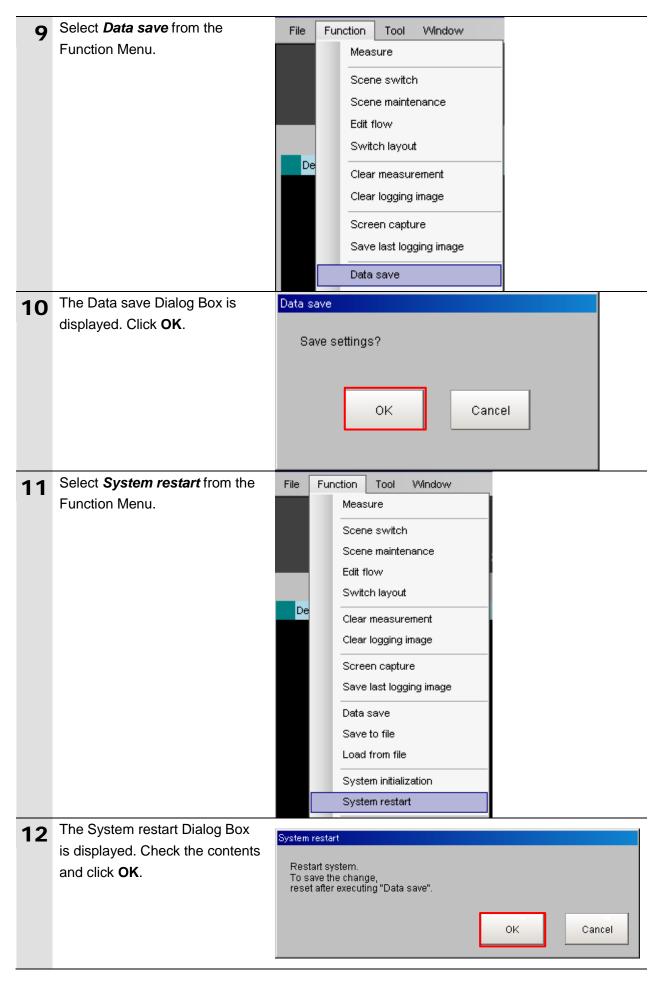

Connect 24 VDC power supply (For Switching hub) to Switching hub.

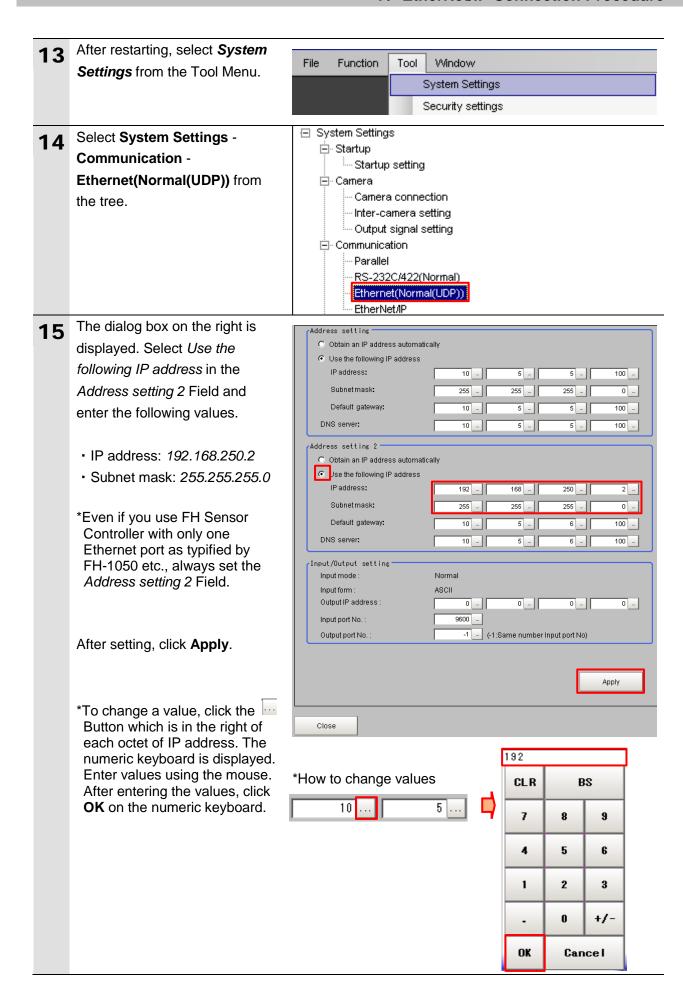

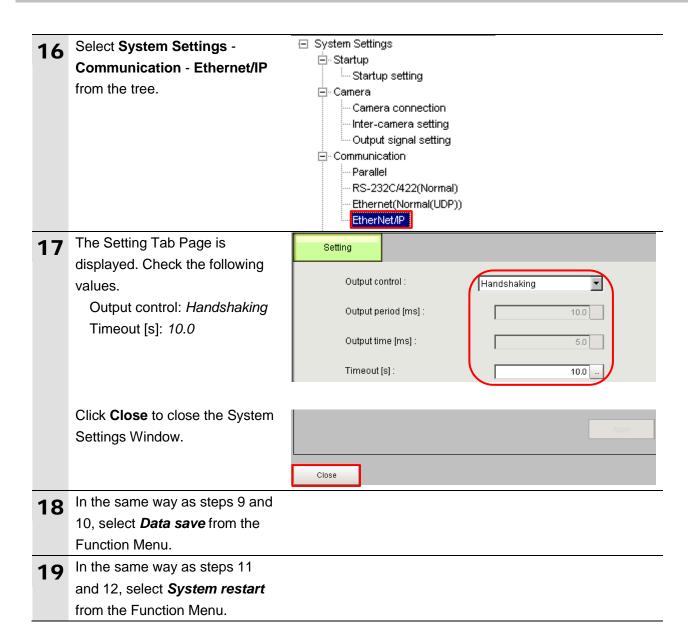

**4** Turn ON the power supply to FH Sensor Controller and Monitor.

# 7.3. Setting up Controller

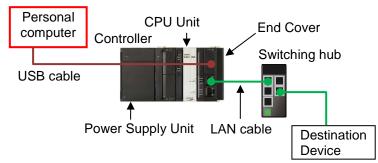

Set up Controller.

# 7.3.1. IP Address Settings

Start Sysmac Studio and set the IP address of Controller.

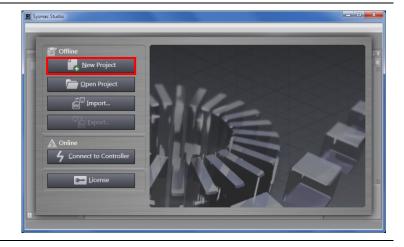

Install Sysmac Studio and USB driver in Personal computer beforehand.

Connect LAN cable to the
Built-in EtherNet/IP port
(PORT1) of Controller, and
connect USB cable to the
peripheral (USB) port. As shown
in 5.2. Device Configuration,
connect Personal computer and
Switching hub to Controller.

- **9** Start Sysmac Studio.
  - \*If a confirmation dialog for an access right is displayed at start, execute a selection to start.
- Sysmac Studio

3 Sysmac Studio starts. Click **New Project**.

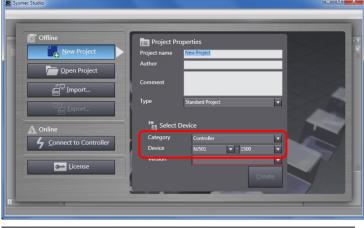

**4** Project Properties Dialog Box is displayed.

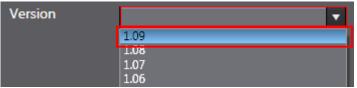

\*In this document, New Project is used as the Project name.

Check that the device used is shown in the *Category* and the *Device* Fields of Select Device.

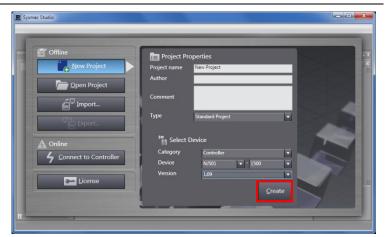

Select an applicable version from the pull-down list of Version.

\*Although 1.09 is selected in this document for example, select the version you actually use.

5 Click Create.

The New Project is displayed.

The following panes are displayed in this window.

Left: Multiview Explorer

Top right: Toolbox

Bottom right: Controller Status Pane

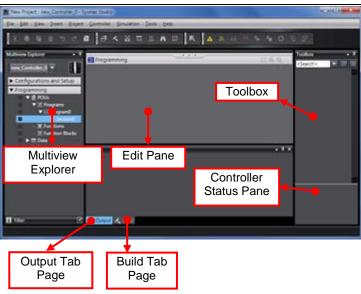

Middle top: Edit Pane

The following tab pages are displayed at the middle bottom of the window.

. . . . . . . .

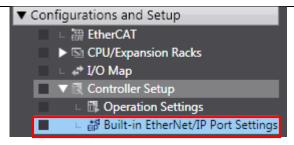

Output Tab Page

**Build Tab Page** 

## 7. EtherNet/IP Connection Procedure

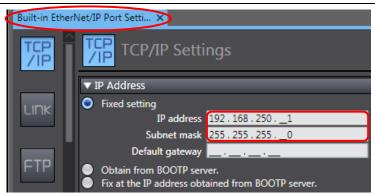

7 Double-click Built-in EtherNet/IP Port Settings under Configurations and Setup - Controller Setup in the Multiview Explorer.

The Built-in EtherNet/IP Port
Settings Tab Page is displayed
in the Edit Pane.

Check that the following settings are made in the *IP Address* Field.

IP address: 192.168.250.1 Subnet mask: 255.255.255.0

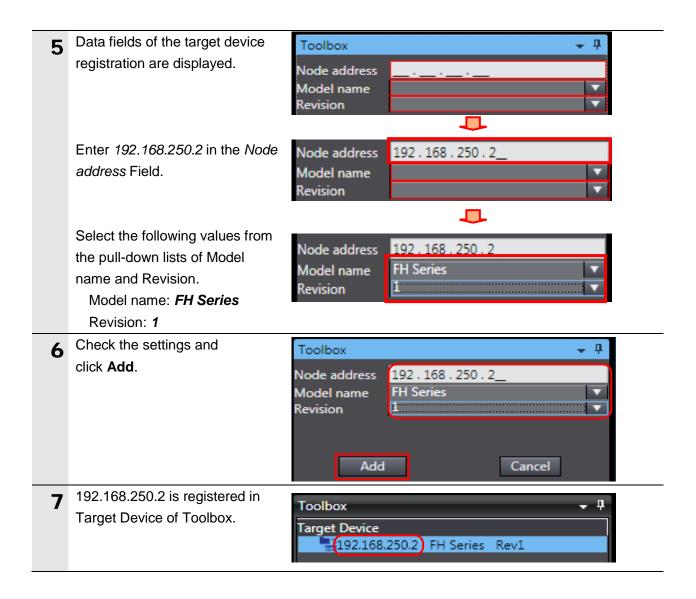

# 7.3.2. Target Device Registration

Register the target device.

Select EtherNet/IP Connection Tools Help Settings from the Tools Menu. Troubleshooting. Backup Export Global Variables Comments for Variables and Data Types > Import ST Program... EtherNet/IP Connection Settings The EtherNet/IP Device List Tab Configurations and Setup Page is displayed in the Edit EtherNet/IP Device List X Pane. Device Node Address Description While the Built-in EtherNet/IP 192.168.250.1 Built-in EtherNet/IP Port Settings NJ501-1500 Port Settings is being selected, Monitor right-click and select Edit from the menu. The Built-in EtherNet/IP Port Configurations and Setup Built-in EtherNet/IP...ection Se. **Settings Connection Settings** Tab Page is displayed in the П-Built-in EtherNet/IP Port Settings Connection Settings Edit Pane. Click the + Button in Toolbox. Toolbox Target Device

## 7. EtherNet/IP Connection Procedure

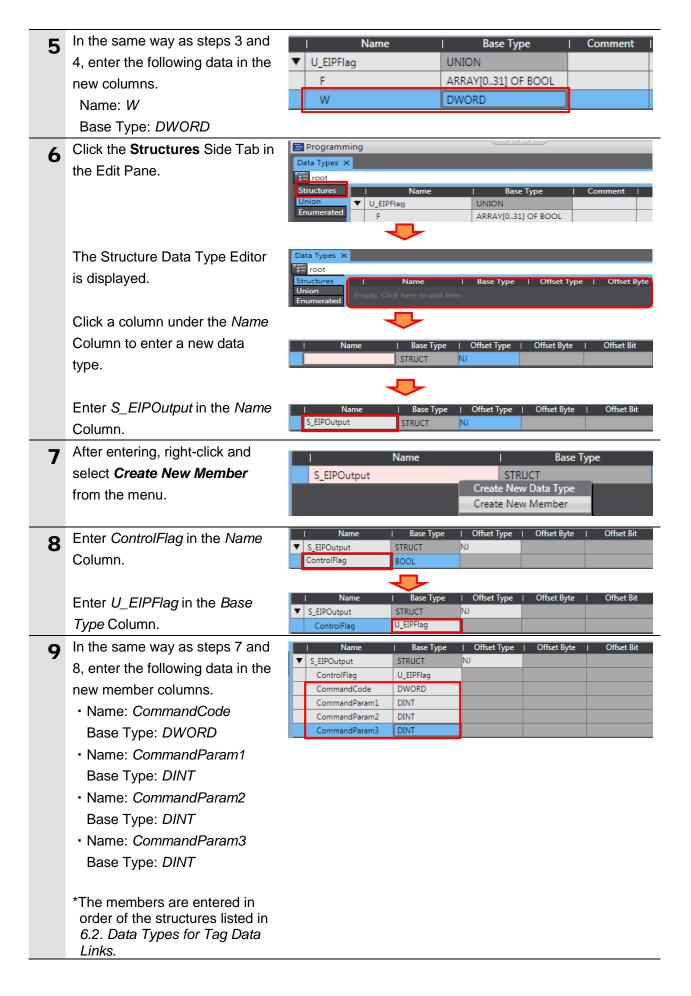

#### 7.3.3. Setting the Global Variables

Set the global variables to use for the tag data links.

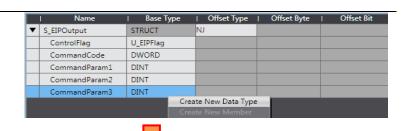

Double-click Data Types under ▼ Programming Programming - Data in the ▼ i POUs Multiview Explorer. ▼ 🏿 Programs ▼ Image: Program0 Section0 Functions **E** Function Blocks V Ⅲ Data Data Types **™** Global Variables Tasks The Data Types Tab Page is Programming Data Types 🗴 displayed. Double-click Global Variables under Programming - Data in the Multiview Explorer.

# 7.3.4. Tag Registration

Register the tags and the tag sets.

Click the Tag Set Button in the Configurations and Setup Built-in EtherNet/IP...ection Se... X Dsk Settings Built-in EtherNet/IP Port **Settings Connection Settings** D-Tab Page. Device Information ▼ Tag Sets Tag Sets/Max: 0 / 32 of: Select the **Input** Tab in Tag Tags/Max: 0 / 256 Sets. Input Output | Tag Set Name | Bit Selection | Size (Byte) | Size (Bit) Return All to Default Right-click any open space in 2 Input Output the Input Tab Page and select Tag Set Name Bit Selection Create New Tag Set from the Create New Tag Set menu. A new name in the Tag Set Input Output Tag Set Name | Bit Selection | Size (Byte) | Size (Bit) | Instance ID | Controller Status Name Column can be entered. Select the column newly added. Enter EIP002\_IN. | Tag Set Name | Bit Selection | Size (Byte) | Size (Bit) | Instance ID | Controller Status

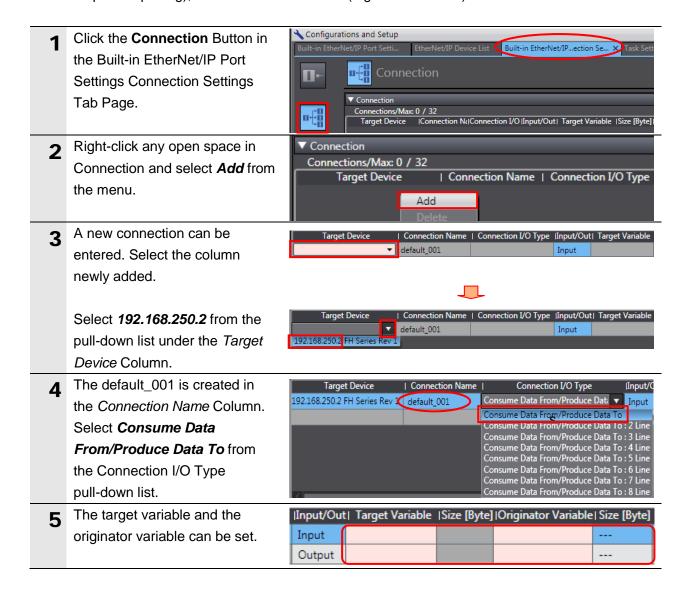

EIP002\_IN

# 7. EtherNet/IP Connection Procedure

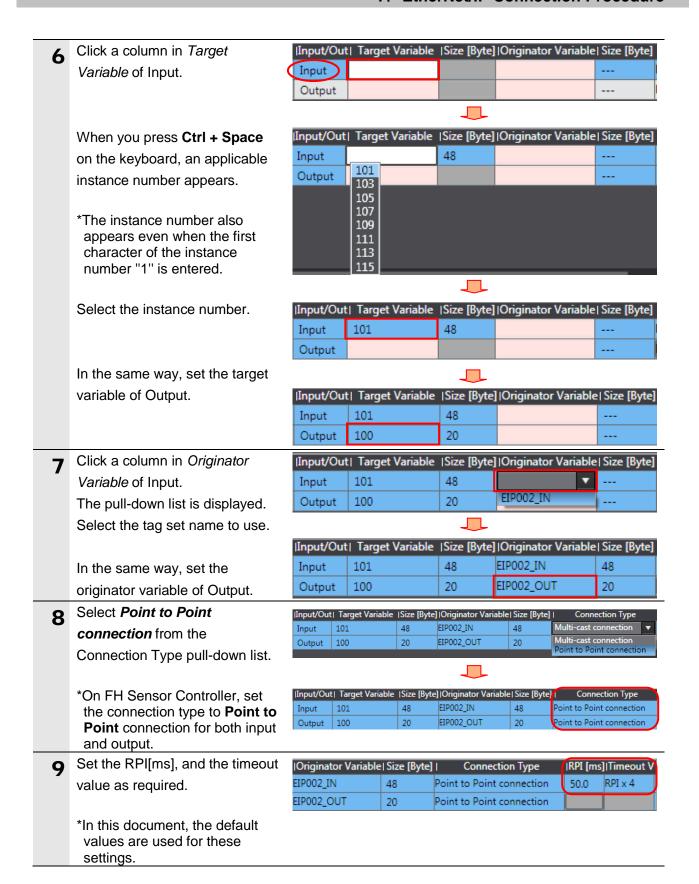

## 7.3.5. Setting the Connections

Set the target variable (that receives the open request) and the originator variable (that requests opening), and set the connections (tag data link table).

#### 7. EtherNet/IP Connection Procedure

#### **Precautions for Correct Use**

Set RPI to 4 ms or longer on FH Sensor Controller.

#### **Precautions for Correct Use**

When the measurement interval is short, the measurement processing load is high, or command processing for operations such as scene group changing is time-consuming, FH Sensor Controller prioritizes measurement and control processing over communication processing. As a result, communication between an external device and FH Sensor Controller may be temporarily interrupted, and a communication error may occur. In this case, set the timeout value as shown below.

Packet Interval (RPI value) X Timeout value > FH Sensor Controller's Processing Time For details on the timeout value of FH Sensor Controller, refer to EtherNet/IP Communications in Communicating with EtherNet/IP in Section 2. Methods for Connecting and Communicating with External Devices of the Vision Sensor FH/FZ5 Series Vision System User's Manual for Communications Settings (Cat. No. Z342).

10 Check that Connections shows

#### 7.3.6. Transferring the Project Data

Connect online and transfer the connection settings and the project data to Controller.

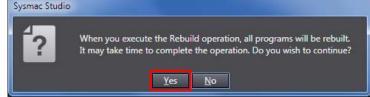

# **№ WARNING**

When you transfer a user program, configuration data, setup data, device variables, or values in memory used for CJ-series Units from Sysmac Studio, the devices or machines may perform unexpected operation regardless of the operating mode of CPU Unit.

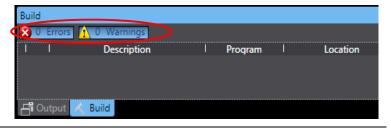

Always confirm safety at the destination node before you transfer the project

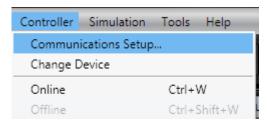

- data. Turn ON the power supply to Controller and Switching hub. Select Check All Programs Project Controller Simulation Too from the Project Menu. Check All Programs The Build Tab Page is displayed. Check that "0 Errors" and "0 Warnings" are displayed. 다 Output 🙏 Build Select Rebuild Controller from 4 Project Controller Simulation Too the Project Menu. Check All Programs F7 Check Selected Programs Shift+F7 **Build Controller** F8 Rebuild Controller A confirmation dialog box is Sysmac Studio 5
  - A confirmation dialog box is displayed. Check the contents and click **Yes**.

6 Check that "0 Errors" and "0 Warnings" are displayed in the Build Tab Page.

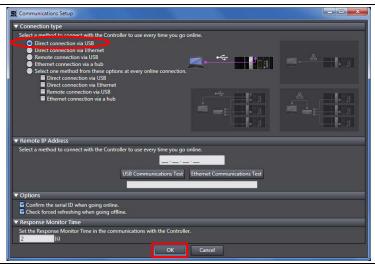

7 Select *Communications Setup* from the Controller Menu.

Problem 2 The Communications Setup Dialog Box is displayed.

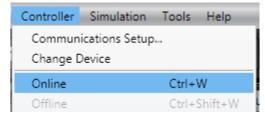

Check that the *Direct connection via USB* Option is selected for the Connection type.

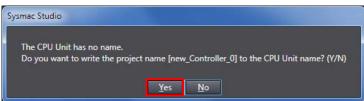

Click **OK**.

Select Online from the Controller Menu. A confirmation dialog box is displayed. Check the contents and click Yes.

> \*The displayed dialog depends on the status of the Controller used. Check the contents and click **OK** or **Yes** to proceed with the processing.

When an online connection is established, a yellow bar is displayed on the top of the Edit Pane.

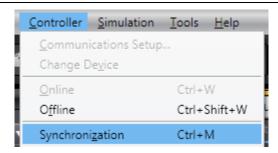

#### **Additional Information**

For details on online connections to Controller, refer to Section 6. Online Connections to a Controller of the Sysmac Studio Version 1 Operation Manual (Cat. No. W504).

11 Select *Synchronization* from the Controller Menu.

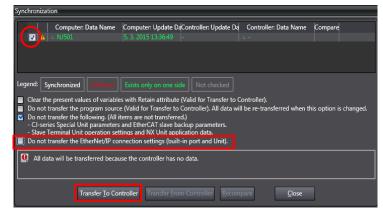

The Synchronization Dialog Box is displayed.

Check that the data to transfer (NJ501 in the right dialog box) is selected.

Uncheck the Do not transfer the EtherNet/IP connection settings (built-in port and Unit).

Click Transfer To Controller.

\*After executing Transfer To Controller, Sysmac Studio data is transferred to Controller and the data is compared.

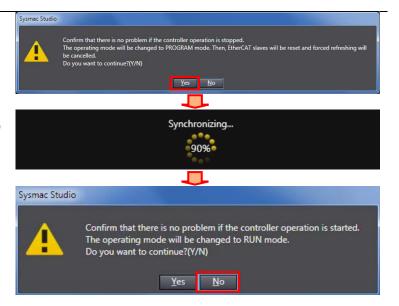

A confirmation dialog box on the right is displayed. Check that there is no problem and click Yes.

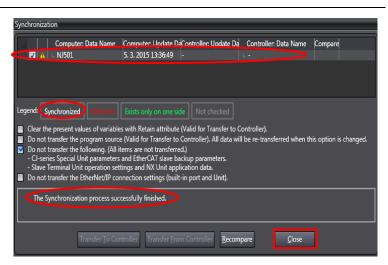

A screen stating "Synchronizing" is displayed.

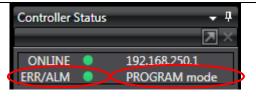

A confirmation dialog box on the right is displayed. Check that there is no problem and click **No**.

\*Do not return to RUN mode.

- 14 Check that the synchronized data is displayed with the color specified by "Synchronized", and that a message is displayed stating "The synchronization process successfully finished". If there is no problem, click Close.
  - \*A message stating "The synchronization process successfully finished" is displayed if the Sysmac Studio project data coincides with the Controller data.
  - \*If the synchronization fails, check the wiring and repeat from step 1.
- 15 Check that ERR/ALM indicator in the Controller Status Pane changes to green color and that PROGRAM mode is displayed.

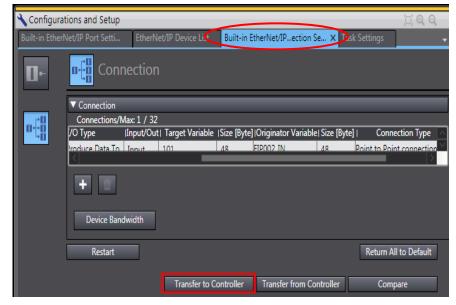

#### **Precautions for Correct Use**

If changing the connection settings (tag data link table) after performing the synchronization, the connection settings (tag data link table) are not transferred even when performing the

synchronization again.

When transferring, click **Transfer to Controller** in the Built-in EtherNet/IP Port Settings
Connection
Settings Tab Page to transfer.

## 7.4. Checking the EtherNet/IP Communications

Check that the EtherNet/IP tag data links are operated normally.

#### 7.4.1. Checking the Connection Status

Check the connection status of EtherNet/IP.

1 Check that the tag data links are performed normally by checking the LED indicators on Controller.

The LED indicators in normal status are as follows:

NET RUN: Green lit NET ERR: Not lit

LINK/ACT: Yellow flashing

(Flashing while packets are being

sent and received)

2 Check the LED indicators on FH Sensor Controller.

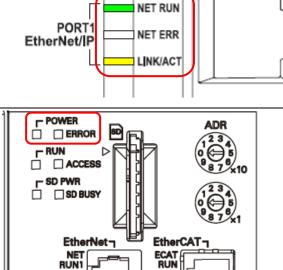

The LED indicators in normal status are as follows:

POWER: Green lit ERROR: Not lit

NET RUN2: Green lit

LINK/ACT2: Orange flashing (Flashing while packets are being

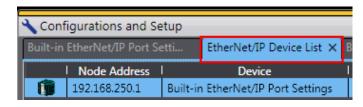

sent and received)

RUN2

LINK/ ACT2

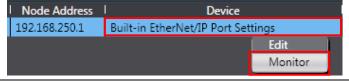

3 Select the EtherNet/IP Device List Tab.

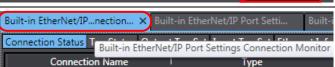

OUT

ECAT ERF

While the Built-in EtherNet/IP Port Settings is being selected, right-click and select *Monitor* from the menu.

The Built-in EtherNet/IP Port
Settings Connection Monitor Tab
Page is displayed.

#### 7. EtherNet/IP Connection Procedure

6 Select the Connection Status Tab.
Check that a blue circle is displayed next to the applicable connection listed in the Connection Name Column.

Check that the Status is 00:0000.

7 Select the Tag Status Tab. Check that all tags in the Tag Name Column are displayed and that green circles are displayed next to them. Check that the statuses for all tags are normally resolved.

#### 7.4.2. Checking the Sent and Received Data

EIPOutput.CommandCode changes

to 00101010.

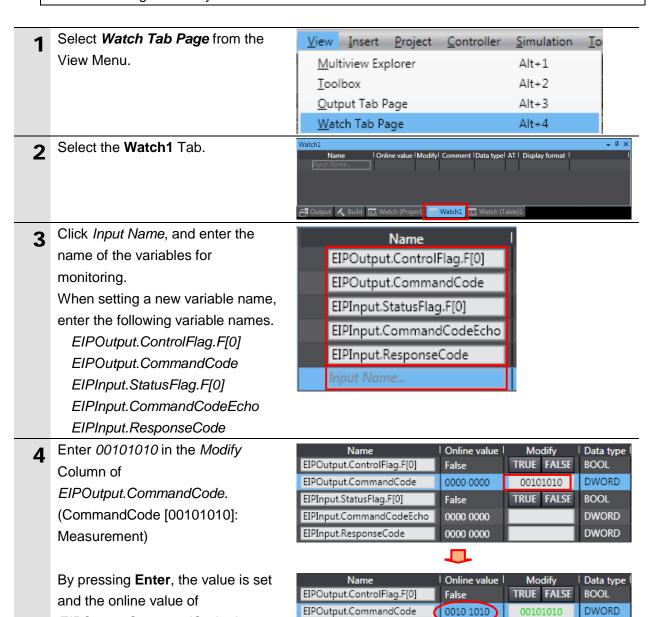

Check that the correct data are sent and received.

# **∕** Caution

If you change the values of variables on a Watch Tab Page in the online state, the connected devices to the output unit may operate regardless of the operating mode of CPU Unit.

Sufficiently confirm safety before you change the values of variables on a Watch Tab Page when Sysmac Studio is online with CPU Unit.

EIPInput.StatusFlag.F[0]

EIPInput.ResponseCode

EIPInput.CommandCodeEcho

TRUE FALSE

False

0000 0000

0000 0000

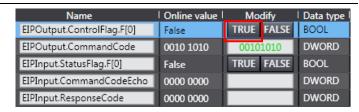

BOOL

DWORD

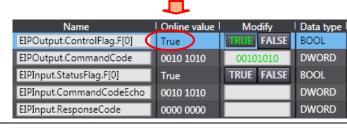

**DWORD** 

#### 7. EtherNet/IP Connection Procedure

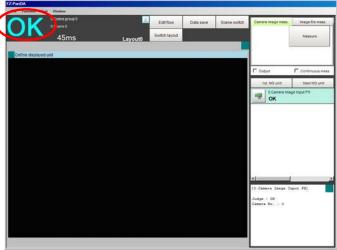

Click **TRUE** in the *Modify* Column of *EIPOutput.ControlFlag.F[0]*.

The online value changes to True. (EIPOutput.ControlFlag.F[0]: Command Execution Bit (EXE))

After completing the measurement, OK is displayed on Monitor.

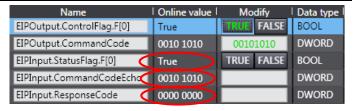

- **7** The online values of EIPInput.StatusFlag.F[0], EIPInput.CommandCodeEcho, and EIPInput.ResponseCode are as follows:
  - EIPInput.StatusFlag.F[0]: True (Command completed)
  - EIPInput.CommandCodeEcho: 00101010

(The sent command code is returned.)

• EIPInput.ResponseCode: 0000 0000

(The execution result of the command 0000 0000: OK or FFFF FFFF: NG is reflected.)

# 8. Initialization Method

This document provides the explanation of the setting procedure based on the factory default setting.

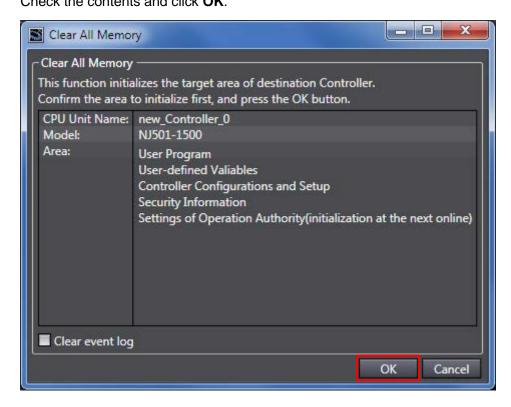

Some settings may not be applicable as described in this document unless you use the devices with the factory default setting.

## 8.1. Initializing Controller

To initialize the settings of Controller, it is necessary to initialize CPU Unit.

Change Controller to PROGRAM mode before the initialization. Select *Clear All Memory* 

from the Controller Menu of Sysmac Studio. The Clear All Memory Dialog Box is displayed. Check the contents and click **OK**.

## 8.2. Initializing FH Sensor Controller

For information on how to initialize FH Sensor Controller, refer to *Initializing the Controller* in Section 1. Before Operation of the Vision Sensor FH/FZ5 Series Vision System User's Manual (Cat. No. Z340).

# 9. Appendix Procedure Using the Project File

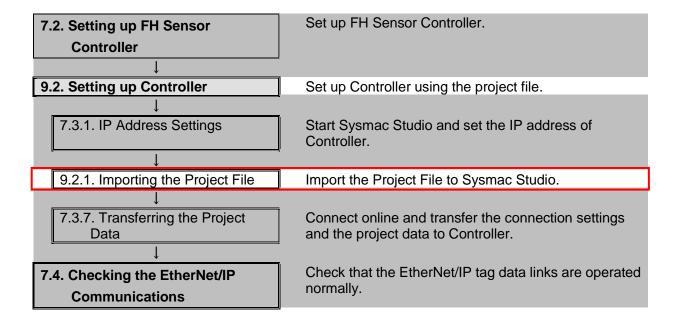

This section describes the procedure in which you use the following project file. The project file includes the contents that are set in 7.3. Setting up the Controller. Obtain the latest project file from OMRON.

Name	File name	Version
Sysmac Studio compact project file (Extension: csm2)	OMRON_FH_EIP_EV200.csm2	Ver.2.00

#### 9.1. Work Flow

Take the following steps to make the tag data link settings for EtherNet/IP using the project file.

Except 9.2.1. Importing the Project File enclosed in red, refer to each appropriate clause and sub-clause for further information.

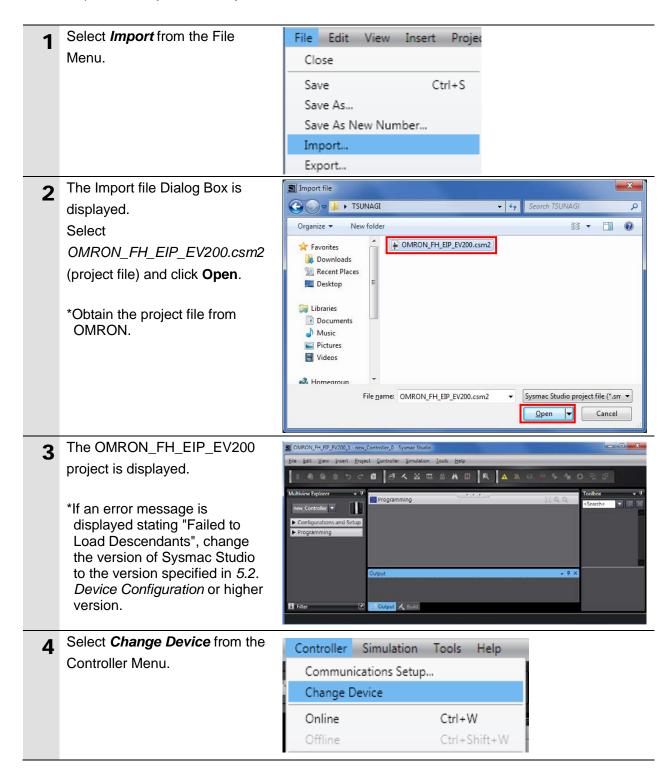

## 9.2. Setting up Controller

Set up Controller using the project file.

#### 9.2.1. Importing the Project File

Import the Project File to Sysmac Studio.

# 9. Appendix Procedure Using the Project File

The Change Device Dialog Box is displayed.

Check that the *Device* and the *Version* Fields are set as shown on the right.

#### Click Cancel.

\*If the settings are different, select the setting items from the pull-down list and click **OK**.

6 If you changed the settings in step 6, the Build Dialog Box is displayed. Check the contents and click **Yes**.

# **10. Revision History**

Revision	Date of revision	Revision reason and revision page
code		
01	September 13, 2013	First edition
02	April 22, 2015	Revisions due to upgraded versions of Controller and
		Sysmac Studio.
		The procedures for EtherNet/IP connection setting changed
		to that by Sysmac Studio.
		Screens changed due to upgraded version of FH Sensor
		Controller.
		Point to Point connection set for input and output.
		Handshaking set for output control confirmed.
